Related Documentation

[1] Capacitive Single Touch Driver, General Functionality
1. Introduction

This document describes the setup and test of the hardware interface to the capacitive Touch Controller FT5x06 from FocalTech. The General Functionality of the driver is described in [1].

2. Register Settings for the Interface

Beside the I2C bus connection the touch panel needs the line /RST to reset the touch panel and the line /INT to signal an interrupt the touch driver.

The SODIMM Pins of the Colibri Modules for these two lines can be defined in the registry. Additional the active level of these two signals and a delay can be defined too (to adapt some logic on the Baseboard which inverts the signals).
All these settings are defined with the registry key:

[HKEY_LOCAL_MACHINE\Drivers\BuiltIn\FT5x06]

The following values can be used:

- **Int_SODIMMPin**: Defines the SODIMM Pin# for the /INT signal from the FT5x06.
- **Int_Signal_Inv**: The active level of the /INT signal is described in the datasheet of the touch panel. This value inverts the active level to adapt level shifter, amplifier etc. on the Baseboard. 0 = not inverted, 1 = inverted.
- **Reset_SODIMMPin**: Defines the SODIMM Pin# for the /RST signal to the FT5x06. Another way to use this signal is to switch the power of the FT5x06 on and off (maybe in case of EMC issues, power off and on is a better way than a reset signal).
- **Reset_Line_Inv**: The active level of the /RST signal is described in the datasheet of the touch panel. This value inverts the active level to adapt power switches etc. on the Baseboard. 0 = not inverted, 1 = inverted.
- **Reset_Post_Delay**: This value can be used to define the delay between the end of the active /RST signal and the first communication over the I2C bus. X = delay in ms
- **I2CSpeed**: Speed of the I2c communication 1=100KB, 2=400KB.
- **I2CAddress**: I2C address of the FT5x06 controller.

The following default values are use if the value is missing in the registry:

- **Int_SODIMMPin**: [133]
- **Int_Signal_Inv**: [0]
- **Reset_SODIMMPin**: [127]
- **Reset_Line_Inv**: [0]
- **Reset_Post_Delay**: [300]
- **I2CSpeed**: [0]
- **I2CAddress**: [0x38]
3. Example of all Registry entries

[HKEY_LOCAL_MACHINE\Drivers\Builtin\SnglTchPanel]

"MouseEmulation"=dword:00000001
"TouchEmulation"=dword:00000000
"CapTouchMapping"="799,479,0,0,799,479,0"
"TouchButton0" = .....

[HKEY_LOCAL_MACHINE\Drivers\Builtin\FT5x06]

"dll"="sngltchdrv_FT5x06.dll"
"prefix"="TCH"
"index"=dword:00000001

"Int_SODIMMPin"=dword:00000085
"Int_Signal_Inv"=dword:00000000
"Reset_SODIMMPin"=dword:0000007F
"Reset_Post_Delay"=dword:00000064
"Reset_Line_Inv"=dword:00000000
"I2CSpeed"=dword:00000002
"I2CAddress"=dword:00000038
"I2CAddress"=dword:00000038

Red line: Values for the Panel Definition (see [1])
Blue line: Values for loading the driver
Green line: Values for the Interface setup
The file

FT5x06_ToolDrv.reg

contains a base register setting without the values for loading the driver (red line).

This file can be modified and imported in the registry (double click on the file).

These registry settings is used by

  Capacitive Single Touch Driver

and partly by

  All Capacitive Single Touch Driver Tools

4. Install the Single Touch Driver

Before installing this driver no other Single Touch Driver should be installed (see chapter 5).

To Install the driver copy the File “SingleTouchDriverFT5x06.cab” to a Colibri (Desktop, Temp folder etc.) and execute it.

The following screen is popping up.

After confirm (OK button) the driver file “sngltchdrv_FT5x06.dll” is copied to "\FlasDisk\System" and all necessary entries in the registry are made.

Save the registry before reboot (Start->ColibriTools->SaveReg).
Remark: Install or reinstall the driver overrides only the settings for loading the driver (see blue line in chapter 3). The other registry entries are not changed or must be adapted to your display/touch and interface.

5. Uninstall the Single Touch Driver

To uninstall the driver use:
“Start->Settings->Control Panel->Remove Program”.

Remark: If you reinstall the driver the settings for load the driver are removed (see blue line in chapter 3).
The other register settings are unchanged and must be removed manual with a registry editor if needed.

6. Capacitive Touch Driver Tools

For testing the hardware and the registry settings are several tools available:

- FT5x06_I2CAdrScan.exe  Scan the I2C bus to detect all active device
- FT5x06_ContrlTest.exe  Show the RAW touch coordinates from the Touch Controller
- FT5x06_DriverTest.exe  Test all settings for the driver

All these tool runs as an application and can be started from the desktop without any installation. The tools use all or some settings of the registry which should be made in advanced (see below).

Remark:

It is not possible to run these tools together with Capacitive Single Touch Driver. In this case the driver must be uninstalled first (see chapter 5.)

If this tools are closed regular (ESC and or Enter) then the tools can be run again. Otherwise the Colibri Modul needs to be restarted.
6.1. FT5x06_I2CAdrScan.exe

This tool resets the Touch Panel using the line /RST and the according settings in the registry. After the reset sequence the tool sends out all I2C addresses and waits for a response. Addresses with a valid acknowledge are shown on the screen.

This tool uses the registry settings for the interface (see green line in chapter 3).

6.2. FT5x06_ContrlTest.exe

This tool is mainly used to test the interface and communication to the Touch Controller FT5x06 and check the panel settings.

The tool resets the Touch Panel using the line /RST according to the settings in the registry. After the reset sequence the tool initializes the touch controller and waits until a finger touches the panel. If the touch controller signals an activity on the touch panel with the /INT line the tool reads out the touch position and displays it on the screen.

The displayed coordinates are in RAW format of the FT5x06 controller.

This tool shows only a single touch and waits until the finger is released. Coordinates of a moving finger are not shown.

The tool is very helpful for compare the resistor settings for the Panel definition (see [1]) with the RAW position of the touch panel.

This tool uses the registry settings for the interface and the adjustments (see green and grey lines in chapter 3).

6.3. FT5x06_DriverTest.exe

With this tool the setting for the driver can be tested because it works with the same registry settings like the real driver does (except the values for loading the driver DLL).

After start the Driver Test Tool reads out the registry settings and prints out some status message on the same port like the Bootloader does (to connect to the Bootloader port you need: a Null Modem Cable a PC with a serial com port (RS232) a terminal application (e.g. HyperTerminal or TeraTerm).

On the standard display is no output from the Driver Test at all.

The Driver Test Tool reads out the touch data and generates the according mouse events. If mouse emulation is set in the registry the cursor on the display should following a touching finger.
This tools use the registry settings for the interface and adjustments (see green line in chapter 3) and the Panel definition (see red and grey linen in chapter 3).

7. Bring up the Touch Panel

After the Hardware connection is setup (I2C Bus, /INT and /RST (if needed) are connected) the following steps and tools helps to bring up the device:

- Set the register values for the Interface at least (see green line in chapter 3).
- Control the settings and wiring of the /RST and /INT lines.
  - With the help of the GPIO Config Tool [2] the chosen SODIMM pin can monitor and set respectively.
- Run the Tool to scan the I2C addresses (FT5x06_I2CAdrScan.exe).
  The tool shows the I2C addresses of all devices on the I2C bus. One of these addresses should be the address of the touch controller.
  Please note the shown addresses are the addresses of the devices on the I2C bus and not addresses set in the registry.
- Run the tool to test the touch controller (FT5x06_CtrtlTest.exe).
  The tool establishes the communication to the touch controller. In case of an error the tool retries it.
  If the communication is ok then the tools waits until a finger touches the panel and shows it position.
- The show position can be used set or verify the register settings for the Panel Definition (see red line in chapter 3).
- Set the register values for the Panel Definition (see red line in chapter 3).
- Run the Driver Test Tool test the settings (FT5x06_DriverTest.exe).
- If mouse events are enabled the cursor on the screen should jump to the position of touching finger. If the finger moves on the touch panel then the cursor should following it.
- If anything works the install the driver (see chapter 4).
